lightmoov
the interactive showcase

lightmoov

The gateway to a new dimension in presentation

lightmoov transforms the interactive showcase into a *hands-on* exhibit that can be virtually touched and explored.

The pointer enables viewers to intuitively choose how much information they want and how comprehensive it should be. Every square centimeter of a showcased exhibit contains its own interactive information point. Depending on how long the pointer rests on any individual spot, the display will automatically show relevant videos and images, as well as triggering corresponding sound and music. A change in the illumination inside the showcase signifies that information is available from the Internet or an intranet. When the showcase is linked to archives, reference sources, research facilities and the like, this can open the door to an intriguing and easy new way of learning and accessing information.

System control

Built into the showcase is a sophisticated presentation system combining cutting-edge led-technology with a unique interactive piloting mechanism. An integrated media database allows increasingly detailed information to unfold interactively for visitors while they are viewing the exhibit. This enables various types of both digital and real information to be linked and communicated in a brand new way. Contexts are created that are at once haptic, informative and experiential in character.

Technology and Construction

In collaboration with Glas+Spiegel-Schulz·Kiel an array of construction models and materials are available and can be keyed to the desired use. We offer presentation boards and showcases for every occasion and exhibit/product: The system also offers interactive presentation table, guest books, menus etc. The showcases are variable, mobile and multi-functional in design.

Extended functions:

- Network configuration of several showcases using WLAN
- Projection and interactive control of display content also possible outside the showcase in real space
- Switches between interactive user-control and program sequence
- Multiuser-function
- Editor mode, to change and expand content
- service monitoring, maintenance and editing via the Internet
